                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      isolated from a family of maize (Zea mays) genes encoding pathogenesis related (PR-1) proteins. The promoters are useful for expressing heterologous genes (including genes for disease resistance) in plants, especially dicots, or monocots i.e. maize. The promoters are useful for the genetic manipulation of plants to exhibit specific phenotypes, particularly enhanced resistance to pathogen-caused disease. Pathogens include viruses such as tobacco or cucumber mosaic virus, ringspot virus, necrosis virus, and maize dwarf virus, and viroids, bacteria, insects, nematodes and fungi. The present sequence represents a maize PR-1 protein given in the present invention.
The present sequence represents a polypeptide which has antibacterial activity. The antibacterial protein and its polynucleotide can be use for the creation of a plant with resistance against pathogenic microbacterial protein and the protein and the protein and the protein activity.

                                                                                                                                                                                                                    It is deduced from cDNA from tobacco mosaic virus (TMV) infected tobacco plants contained in plasmid pNtSNRcPilc/83. Expression of a recombinant DNA molecule that encodes P-R proteins and regulatory sequences in a plant enhances the hypersensitive response of the plant to an invading pathogen. The calculated molecular weight of the mature PR-protein is 15,129 and is in reasonable agreement with the Mr of 18kD estimated by SDS polyacrylamide gene electrophoresis.
                                                                                                                                                                                                                                                                                                                                   Pathogenesis-related proteins used for expression in plants to invading pathogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nicotiana

                                                                                                                                                                                                                                                                                                                          This is the sequence of the plant pathogenesis-related protein (PRP), PR-1b. It confers systemic acquired resistance to plants. The corresp. DNA is used, in a chimeric construct, to produce transgenic plant cells or -tissues with the ability to regenerate into plants which are disease resistant. Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prediction; secondary structure; alignment; evolutionary conservation;

sequences AAY43902-Y44015 represent proteins used in a novel method of predicting the folded structure of proteins, by aligning sequences of homologous proteins and using patterns of evolutionarily conserved and varied sequences to assign positions. Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for
                                                               Protein identification; signal transduction pathway; metabolic hybridisation assay; genetic mapping; gene expression control; termination sequence.

                                                                                                                                                                                                                                       This is the plant pathogenesis-related protein (PRP), PR-1c. It confers systemic acquired resistance to plants. The corresp. DNA is used, in a chimeric construct, to produce transgenic plant cells or -tissues with the ability to regenerate into plants which are disease resistant.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                         US-09-832-320-3

These steps were performed in the TJ Close lab (Choi) at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing) Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above.                         /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2: XhoI; The Harrosoy NIL was constructed and seed was provided by Dr. J. Specht, University of Nebraska (Shoemaker and Specht, 1995). The cDNA library was constructed from mRNA isolated from whole seedlings of 1 week old greenhouse grown plants. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site and a 3' anchor. EcoRI adapters were ligated to the blunt-ended cDNA fragments were directionally cloned into the EcoNa fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). The library was constructed in cooperation
with Dr. Paul Keim's laboratory at Northern Arizona
